

The AI agent that confirms, de-risks and ships cash-on-delivery orders for Egyptian social-commerce shops — without a human in the loop.

DM in → order confirmed → deposit verified → courier booked

**88 h**

returned to the owner / month

**25% → 9%**

COD refusal rate

**56,379 EGP**

monthly impact (projected)

# Instagram & WhatsApp shops that live on cash-on-delivery

## Pilot profile

### Nour Boutique (نور بوتيك)

- Women's fashion, sells only via Instagram, Facebook & WhatsApp DMs
- ~600 orders / month, almost all cash-on-delivery
- 1 person answers DMs, confirms, books the courier
- ~9 min of manual handling per order
- ~25% of parcels refused at the door
- Each refusal costs ~120 EGP (shipping + return) and a week of stock

## Why this segment

### Huge

Social commerce is how most small Egyptian brands sell — no website, no checkout, just DMs.

### Cash-first

COD dominates, so the shop carries the risk of every order until the courier collects.

### Painful

Refusals, fake transfer screenshots and slow replies are the #1 complaints of these owners.

### Underserved

Global tools (Shopify bots, US chatbots) don't speak Egyptian Arabic or InstaPay.

## THE WORKFLOW WE REPLACED

# From 9 minutes of copy-paste per order to zero

### BEFORE — a person does this for every order

|                                                |              |
|------------------------------------------------|--------------|
| Read messy DM, ask for size / colour / address | 3 min        |
| Copy order into a sheet or notebook            | 1.5 min      |
| Call / message to confirm the order            | 2 min        |
| Chase InstaPay screenshot, check it by eye     | 1.5 min      |
| Book courier, send tracking to customer        | 1 min        |
| Absorb refused parcels (~1 in 4)               | 120 EGP each |

### AFTER — Ta2keed does it, 24/7

|                                                                             |
|-----------------------------------------------------------------------------|
| Understands Egyptian Arabic, Franco & voice notes; asks only what's missing |
| Writes the order to the database + CSV/Excel export                         |
| Sends a clear order summary; customer just replies "OK"                     |
| Reads the receipt, checks amount, recipient, status & re-use                |
| Books Bosta and sends tracking automatically                                |
| Scores refusal risk and asks risky orders for a deposit first               |

Human time per order: **9 min → 0 min** (owner only reviews the daily digest)

# One conversation, eight autonomous steps

## 1 Understand

Arabic / Franco / voice → items, size, colour, name, phone, address, zone

## 2 Complete

Asks for only the missing field, pushes for building & floor

## 3 Upsell

Offers a matching item at a small discount

## 4 Score risk

Explainable COD-refusal score with reasons

## 5 Deposit

Risky orders pay 100 EGP via InstaPay / Vodafone Cash

## 6 Verify

Receipt fraud checks: recipient, amount, status, re-use

## 7 Ship

Books Bosta, sends tracking & amount due

## 8 Report

Live dashboard, CSV, Telegram daily digest

**Safe by design:** a deterministic state machine owns prices, deposits and shipments. The (optional) LLM only reads text and images — a prompt can't make an order free.

# A live agent: four real conversations, zero human touches

## Measured in the demo run

Conversations handled 4

Orders auto-confirmed & shipped **3**

Risky orders flagged 2

Fake receipts blocked **1**

Deposits verified **1 (100 EGP)**

Risky parcels NOT shipped **1 (saved 125 EGP)**

Upsells accepted **1/3 (+120 EGP)**

Human minutes spent 0

## MEASURED BUSINESS IMPACT

# 56,379 EGP per month for a 600-order shop

### DOES IT WORK?

✓ **Live**

WhatsApp / Telegram / web chat, courier booking, receipt checks — end to end

### TIME SAVED

**88 h / mo**

600 orders × 9 min no longer done by hand ≈ half a full-time job

### COST SAVED

**15,696 EGP**

Staff time 3,960 EGP + refused-parcel losses avoided 11,736 EGP

### REVENUE GENERATED

**40,683 EGP**

Upsell 12,600 EGP + after-hours orders 16,200 EGP + saved orders 11,883 EGP

Refusal rate **25% → 8.7%**  
≈ 98 fewer refused parcels every month

**56,379 EGP**  
total monthly impact (cost saved + new revenue)

Projection from the pilot baseline (slide 9 lists every assumption). Measured counters come from the agent's event log.

# Monthly impact breakdown

## Reading the chart

- Cost saved** — time the owner gets back
- Cost saved** — outbound + return fees on parcels that would have been refused
- New revenue** — upsells, DMs answered at 2 AM, and orders the deposit turns into real sales

**Biggest single lever:** the deposit gate. It only asks the ~30% riskiest orders for 100 EGP, so good customers never feel friction.

# Built for the Egyptian market and for money-safety

## Speaks the customer's language

Egyptian Arabic, Franco-Arabic, Arabic-Indic digits, voice notes, Egyptian areas → shipping zones

## Local payment rails

InstaPay & Vodafone Cash deposits with screenshot fraud checks (wrong account, low amount, failed, reused)

## Can't be talked into losses

Prices, totals, deposits and shipments are code, not LLM output — prompt-injection test included

## Explainable decisions

Every risk score lists its reasons; every action is logged and visible to the owner

## Zero setup, zero cost to try

Runs fully offline with no API keys; add an LLM, WhatsApp, Telegram or Bosta key when ready

## New shop in minutes

Catalogue, upsell pairs, zones, fees and deposit policy live in one store.json file

HOW WE MEASURED

# Every number is traceable

Measured by the agent (event log)

- orders created / confirmed / auto-shipped
- risky orders flagged and their reasons
- deposits verified, fake receipts blocked
- risky parcels stopped before shipping + fees saved
- upsells offered vs accepted, upsell revenue
- after-hours orders, human minutes spent

Live at /api/impact and on the dashboard.

Pilot baseline used for the monthly projection

|                               |                     |
|-------------------------------|---------------------|
| Orders / month                | 600                 |
| Manual minutes / order        | 9                   |
| Staff cost / hour             | 45 EGP              |
| Baseline refusal rate         | 25%                 |
| Refusal rate with deposit     | 4%                  |
| Share of orders flagged risky | 30%                 |
| Loss per refused parcel       | 120 EGP             |
| Average basket                | 540 EGP             |
| Gross margin                  | 45%                 |
| Upsell acceptance used        | 22% (capped at 25%) |

Conservative by design: upsell rate is blended with a 15% prior and capped; only half of saved orders are counted as sales.

## WHAT'S NEXT

# From hackathon to a product SMEs hire on Wesam

**750 EGP**

**suggested price / month**

Less than one refused parcel a day

**75×**

**return on price for the pilot shop**

Pays for itself in the first ~day

**< 1 day**

**to onboard a new shop**

Edit store.json, connect WhatsApp number

## Roadmap

### Now

Web + Telegram + WhatsApp webhook, Bosta, receipt checks, dashboard

### Next 30 days

Pilot with 3 real shops; calibrate risk weights on their order history

### Then

Instagram DM channel, Shopify/WooCommerce sync, courier status → auto follow-ups

### Scale

List on Wesam's marketplace so any Egyptian SME can hire it in one click

# Run it in under five minutes

## Judge quick-start

```
git clone https://github.com/MahmoudJimmey/Ta2keed
cd Ta2keed
./run.sh          # Windows: run.bat
# open http://localhost:8000 → ▶ Play demo

pytest -q         # 18 tests
```

No API keys, no accounts, no database server.  
Optional .env adds LLM, WhatsApp, Telegram, Bosta.

## Four demo scenarios

1. Messy Franco/Arabic order → upsell → confirmed → shipped
2. Risky first-time order → InstaPay deposit → fake screenshot caught → real one accepted
3. Customer with 3 past refusals → deposit required → customer cancels (return fee saved)
4. Customer asks questions first (shipping, sizes) then orders

# What could go wrong — and how we handle it

**Rules miss an unusual message**

Falls back to the LLM when configured; always asks instead of guessing; owner sees every order

**Fake receipts get more sophisticated**

Checks recipient, amount, status, duplicate reference & image hash; flags edited-looking screenshots; owner alert

**Deposit annoys good customers**

Only the riskiest ~30% are asked; trusted repeat buyers get a lower score automatically

**Risk weights are generic**

Transparent weights; calibrate on each shop's own delivered/refused history

**WhatsApp API needs Meta approval**

Telegram + web chat work today; WhatsApp webhook is implemented and ready

# Every COD order confirmed, de-risked, shipped.

No human in the loop. No new app for the customer. Just WhatsApp.

**88 h**

time saved / month

**15,696 EGP**

cost saved / month

**40,683 EGP**

new revenue / month
